

TECHNICAL IMPLEMENTATION PLAN

Real Authentication: Login & Sign-Up Modal

Architecture Blueprint for Supabase Auth, Guest Roaming, and Conversion Gates

🔑 Core Architecture & Sign-In Methods

- **Email & Password / Magic Link:** Zero external configuration needed. Operates out-of-the-box using your free Supabase project.
- **Google 1-Tap / OAuth:** Included in the modal interface for instant 1-click registration.
- **Open Roaming Guarantee:** Visitors can view all homestays, parties, travel buddies, and tours without an account.
- **Automatic Cloud Profile Creation:** When a user registers, their row is automatically recorded in the `profiles` PostgreSQL table in Mumbai.

⚙️ Components to Be Built & Modified

- **`src/components/auth/AuthModal.tsx`:** Interactive modal supporting Sign In, Sign Up, Google button, loading feedback, and smooth dismissal.
- **`src/lib/supabase.ts`:** Authentication helper methods (`signUp`, `signIn`, `signOut`, `onAuthStateChange` listener).
- **`src/context/AppContext.tsx`:** Manages auth state, exposes login modal opener, and syncs session with cloud database.
- **`src/components/layout/Navbar.tsx`:** Displays "Log In" / "Sign Up" for guests, and User Avatar / Menu / "Log Out" for authenticated members.
- **Action Guards (Listing Detail, Chat, Host Wizard):** Intercepts high-intent actions with a friendly *"Sign in to confirm"* prompt without page reloads.

✓ Verification & Auto-Deploy

- Full Next.js production build check (`npm run build`) to ensure 0 TypeScript or linting errors.
- Verification of session persistence across browser reloads.
- Automatic push to GitHub (Techguybaba/roammeet) triggering seamless Vercel production deployment.
